

Lavochkin La - 7

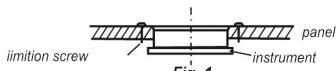

The following procedure is recommended to achieve high-quality final appearance :

If contained in the kit, carefully clean and degrease the PUR items. To apply their colour finish by spraying or coating, use enamels for plastic kits. If water-type decals are contained in the model kit, cut out respective stencils, insert into lukewarm water and, when the stencils may be moved on its paper base, apply to a respective place. Remove access water with soft cloth.

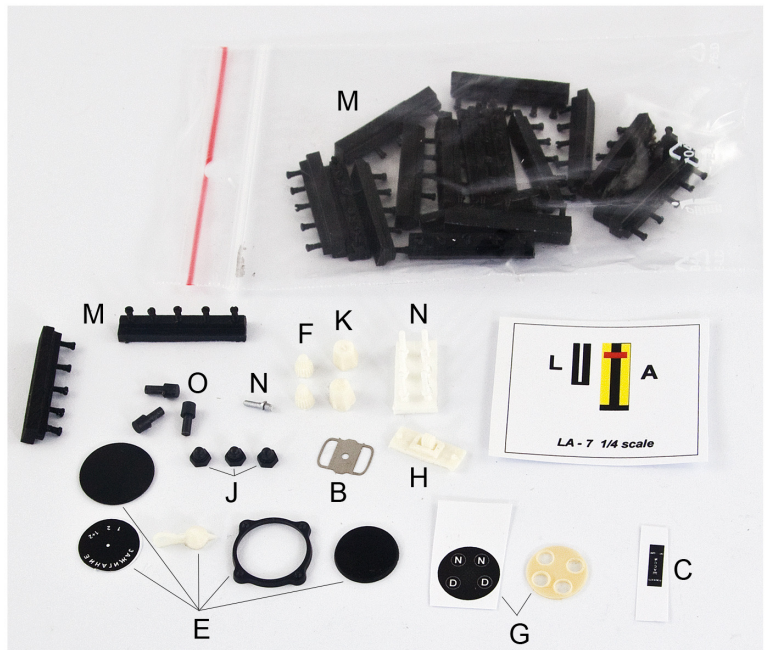

If the model kit contains photo etched parts, fore them, carefully following instructions, and cement them, applying acrylic cement as well.

We recommend you to provide information and warning labels with a two-sided adhesive tape, to cut them carefully out, black their edges and stick to their respective place.

Following the instructions for their positioning, insert particular instruments from side of the panel. After having the instruments carefully aligned, cement them with cement for plastic materials. Instruments not containing bezels are to be aligned with the surface of the instrument panel (see Fig. 1). Layout type A

On these instruments four screws, which fix the instrument to the panel, are to be outlined (see Fig.2).
